Device observations and tester feedback

AgriSoko Pocket G13 | INES Ruhengeri | 23 October 2026

Repository: https://github.com/nzerneste250/agrisoko-pocket-g13

Release: https://github.com/nzerneste250/agrisoko-pocket-g13/releases/tag/v1.0.0

Observed device experience

A physical Android phone displayed the standalone AgriSoko Pocket G13 application. User-provided screenshots show Home, Ask the Team, Member Directory and About and Evidence screens, including a bundled offline member list.

The About screen reported a failed request to the private network backend address http://172.30.114.74:8000. Successful online AI lookup from the phone is not established.

Recorded observations

Positive: application launches, screens render and the member directory shows four listed people.

Issues: visible text-encoding artifact ("Â·"), backend fetch cancellation, connectivity label that may not reflect backend reachability, pending member details, large buttons and long unsectioned technical copy.

These are screenshot-based observations, not consented independent tester testimonials.

Feedback requirements and status

Verified independent tester count from supplied evidence: zero. The assignment requires four actual testers, at least two external to the team, with consented observation records.

At least two reproducible issues should be linked to GitHub issues and commits with actual retesting. The screenshots identify potential issues but do not prove fixes.

No fake user quotes, improvement metrics, satisfaction ratings or tester identities are included.
